November 2003

## **INTRODUCTION**

Since 1998, there has been a collaborative effort among a number of research groups conducting photographic identification of gray whales in the Pacific Northwest (Calambokidis et al. 2000, 2002a, 2002b). This report summarizes field effort conducted by Cascadia Research in 2002 for gray whales and the results of the photographic comparison from this effort as well as that from field work conducted by the National Marine Mammal Laboratory (NMML), University of Victoria, West Coast Whale Research Foundation, the Marine Mammal Education and Research Program (MMERP) at Humboldt State University, Coastal Ecosystems Research Foundation, and the operator of the Juan de Fuca Express (a coastal ferry service). The field effort reported and these comparisons were conducted under contract to NMML.

## **METHODS**

Surveys were conducted from California to British Columbia by Cascadia Research and collaborating researchers. Survey effort is described in detail below for Cascadia Research. Only brief summaries of the effort by collaborating researchers is provided here with more complete information available in the reports by the individual research groups.

### **Effort by Cascadia Research**

A total of 22 surveys were conducted by Cascadia Research in 2002 between 6 April and 16 October in the waters off California, Oregon, and Washington (Table 1). This included both dedicated and opportunistic surveys. These surveys yielded 135 identifications of 71 unique gray whales (Table 2). A summary of the survey effort conducted is summarized below:

- A small boat survey was conducted in northern Puget Sound on 1 May 2002 out of Everett and covered Saratoga Passage and the waters around Camano and Whidbey Islands. Three opportunistic surveys were conducted aboard the whale-watch vessel *Keet* (operated by Mosquito Fleet out of Everett).
- Four surveys were conducted around in BC waters from 31 July to 7 August 2002 as part of a collaborative survey with Canada Department of Fisheries and Oceans. Gray whales were identified along the northern coast of Vancouver Island on three days and in the Cape Caution area on one day. A search was also conducted of gray whale habitat on the eastern side of the Queen Charlotte Islands but none were seen.
- One survey was conducted out of La Push covering waters along the northern Washington Coast on 16 July 2002 using Cascadia's RHIB. This included offshore effort to search for humpback whales.
- Nine surveys were conducted off Oregon from 11 August to 16 October 2002 using Cascadia's RHIB. Some of these were in association with humpback whale effort offshore. Three days of surveys out of Port Orford were the most productive for obtaining gray whale identification photographs.
- Four surveys were conducted for gray whales in two regions off northern California from 17 August to 13 October 2002.

## **Effort by NMML and collaborators**

Collaborating researchers conducted surveys to identify gray whales in a number of areas. Details of identifications obtained by NMML and Humboldt State University are provided in Tables 3-4 and overall summaries for all collaborating researchers are listed in Tables 5-6 as well as summarized below:

- **National Marine Mammal Laboratory:** NMML obtained suitable identification photographs of gray whales from 88 encounters representing 65 unique individuals. Most of these were from Kodiak Island (60 encounters of 42 individuals) with a small numbers of identifications from California, Oregon, Washington, and British Columbia (Table 3, 6).
- **Humboldt State University:** HSU conducted surveys off northern California and obtained 71 identifications of 35 individual whales. Identifications were obtained from 13 June to 18 October 2002 (Tables 4,6).
- **Brian Gisborne, Juan de Fuca Express:** Brian Gisborne obtained 435 identifications of 69 unique whales as part of his water taxi service between Port Renfrew and Bamfield. Identifications were obtained along the southern portion of Vancouver Island from 12 May to 4 October 2002.
- **Jim Darling, West Coast Whale Research Foundation:** Jim conducted surveys along the west coast of Vancouver Island from Clayoquot Sound south to Barkley Sound on four days from 5 July to 1 October 2002. These yielded 14 identifications of 12 unique whales.
- **Coastal Ecosystems Research Foundation:** CERF obtained identifications 1 July to 14 September 2002 primarily in the vicinity of Cape Caution. Identification photographs were obtained on 295 occasions representing 41 unique individuals.
- **University of Victoria:** UVIC obtained identifications photographs from Clayoquot Sound north along the west side of Vancouver Island from 5 July to 3 September 2002. Identification photographs were obtained on 121 occasions of 83 unique individuals.

## **Photographic identification procedures**

Procedures during Cascadia vessel surveys were similar to those used previously (Calambokidis *et al.* 1994). Effort data were recorded every 30 min and when there was either a course change or a change in the environmental conditions. We recorded time, position (latitude and longitude from GPS) and environmental conditions (sea state, visibility, precipitation, cloud cover, and swell height). When a gray whale was found, the time, position, number of animals, and behaviors were recorded. Whales were approached to 30-50 m and followed through several dive sequences until suitable identification photographs could be obtained. At the end of a sighting the time, location, and roll and frame numbers of photographs taken during each observation were also noted.

For photographic identification of gray whales, both left and right sides of the dorsal region around the dorsal hump were photographed when possible. *Ilford* HP-5 negative film was used with *Nikon* 35mm cameras with 300mm f4.5 lenses. We also photographed the ventral surface of the flukes for identification when possible. The latter method was not as reliable as the sides of the whale because the gray whales did not always raise their flukes out of the water. Markings used to distinguish whales included pigmentation of the skin, mottling, and scarring, which varied among individuals. These markings have provided a reliable means of identifying gray whales (Darling 1984). We also identified gray whale using the relative spacing between the knuckles along the ridge of the back behind the dorsal hump. The size and spacing of these bumps varies among whales and does not change over the years we have tracked whales.

Comparisons of whale photographs were made in a series of steps. First, all negatives of gray whales were examined and the best shot of the right and left sides of each whale (for each sighting) were selected and printed (7 x 2.5 inch). To determine the number of whales seen during the season, the prints were then compared to one another to identify whales seen multiple days. Finally a comparison was made to our catalog of whales seen in past years. Whale photographs that were deemed of suitable quality but did not match our existing catalog (compared by two independent matchers) were assigned a new identification number and added to the catalog.

### **Analysis procedures**

To examine interchange of whales among regions and control for sample size we computed an interchange index, which is similar to the inverse of a Petersen capture-recapture estimator (Calambokidis *et al.* 2001). This was calculated as:

$$\text{Interchange Index} = \frac{\# \text{matching}}{(n1 * n2)} * 100$$

A Petersen capture-recapture model was used to estimate abundance as has been done in a variety of studies relying on photographic identification of large whales (Hammond 1986, Calambokidis and Barlow In Press) and has been used for gray whales in the past (Calambokidis *et al.* 2002a).

## RESULTS AND DISCUSSION

Photographs by all collaborating organizations yielded 1,159 identifications (a time and location a whale was identified) of 253 different individual gray whales (after within-year resightings) in 2002 (Table 6 and 7). This is more total identifications and different individuals than has been identified in any past year. Identifications were obtained from a broad area from Northern California to Kodiak, Alaska. Large samples with close to 100 identifications representing more than 40 different individuals were obtained from many regions including California, Oregon, S Vancouver Is., W Vancouver Is., and N Vancouver Island. The small number of identifications from Puget Sound were from early in the season (prior to 1 June).

Among the 253 whales identified, 152 or 60% were whales known from previous years and already in the catalog maintained at Cascadia. The proportion of whales known from previous years varied somewhat by region (Table 6) but for all areas with substantial samples, except Kodiak, it was well over 50% (Table 6). All three sub-areas of British Columbia had very high proportions of whales known from previous years (74-80%).

Identifications from Kodiak, Alaska provided the first opportunity to look at interchange with this region. Out of 42 unique whales identified in that region in 2002, 4 had been previously identified in other areas. While this is a much a lower proportion (10%) than in our study regions it is surprising because it is farther north than whales in the Pacific Northwest feeding aggregation had been previously identified.

Sighting histories of three of the four whales identified in Kodiak in 2002 that had been seen in previous years in the Pacific Northwest were atypical (Table 7). Only one had a long sighting history; ID #152 had been seen as early as 1992 by Jim Darling (his ID 92-14) in the Clayoquot Sound area and as early as 1995 by CERF (their ID G032) in the Cape Caution area. Since 1998 it had only been seen in August and September of 1999 by NMML along the west coast of Vancouver Island. Two others (ID# 232 and 566) had only been seen in previous years in the Pacific Northwest when they were mothers with calves. ID#232, a very distinct animal with a large bulge on the right side, had been seen multiple times off Vancouver Island in 1998 by CRC, Gisborne, and NMML and in 2001 by Gisborne and Darling in all cases accompanied by a calf (ID#620 in 2001). ID#566 had only been seen as a mom with a calf in July 2000 by HSU in northern California (mom of Pea). The fourth whale (ID#639) had only been seen once at that was in California as well on 28 October 2001 .

Movements among most other areas in 2002 were fairly common (Tables 8 and 9). Interchange rates were highest among close neighboring areas with SJF-NWA, SJF-SVI, NWA-SVI, and SVI-WVI all having indexes greater than 0.6 (shown in bold in Table 9). Intermediate interchange rates were seen among regions more widely separated and lowest rates or no interchange seen among the most distant sites. Whales identified in Oregon or California were not seen off the most northern BC sites and only at low interchange rates with the N Washington or S Vancouver Island sites. As has been the case in the past, the few whales seen in northern Puget Sound early in the season were not seen in any other region.

Except for the Northern Puget Sound whales, most other individuals identified early in the season (April and May) were resighted later in the season (Table 10). Both the whales identified in April were resighted in July through September. The same was true for the late season whales; some whales identified in October had been seen in every month after April.

Capture-recapture estimates of abundance using the 2002 identifications yielded results very similar to previous years (Table 11). We did not include Kodiak in these estimates because of the low interchange rate between all other areas and Kodiak and because this area had not been sampled in past years. Estimates excluding California and Oregon came out at around 200 and estimates with California and Oregon at 264-279 (Table 11). One new aspect of the 2001-2002 estimates is that these are now broken down by right and left sides. More complete data from all participants allowed us to generate separate estimates by sides and avoid the small bias due to missed matches for whales that were only known by single sides.

## ACKNOWLEDGEMENTS

Support for the photographic identification reported here, the comparison of gray whale photographs and preparation of this report on the 2002 field season came primarily from the National Marine Mammal Laboratory. Some of Cascadia's field effort on gray whales was conducted incidental to humpback whale research for the Southwest Fisheries Science Center and the Olympic Coast National Marine Sanctuary. A number of individuals helped arrange support for this work including Jeff Laake, Joe Scordino, Robert DeLong, Jay Barlow, and Ed Bowlby. Permission to conduct some portions of this research was provided by the U.S. National Marine Fisheries Service and the Makah Tribal Nation.

We thank the operators of the boats that allowed us to gather data from their boats including the *Keet* (operated by Mosquito Fleet) in northern Puget Sound. A number of people assisted in the field effort and in the printing and matching of photographs. We thank our volunteers and interns whose assistance in the field and in the processing of the photographic identifications was invaluable. They include Oscar Torres, Katie Luxa, Randy Lumper, Julia Erickson, Nora Moloney, Suzanne Stricker, and Cody Massing. Todd Chandler conducted some of the surveys off Oregon and northern California.

Kecia Kerr assisted in the University of Victoria gray whale effort in 2002. HSU acknowledges Misty Neimeyer, Sierra Deutsch and Alicia Mallo who conducted many of the surveys off northern California; Humboldt State's Department of Undergraduate Education and the Department of Biological Sciences for their support; MMERP interns that conducted gray whale shore surveys; and the US Coast Guard Group Humboldt Bay for their assistance in locating whales offshore.

CERF acknowledges the 2003 students & volunteers who spent so many hours scanning the ocean for signs of gray whales, those who sent in photographs, and Ken Gillis (Duncanby Landing) for logistical support. Additional funding for the CERF effort was provided by the University of California at Los Angeles, and the University of British Columbia; Becky Woodward and Jeremy Winn were funded by a Maine Sea Grant to the University of Maine; Computer equipment and salary support for William Megill during the analysis & write-up stages of this research were provided by the University of Bath.
